Utah Tech University

POLICY 149b: Approved Methods and Procedures for Electronic Signatures Addendum B

Approved Methods and Procedures for Electronic signatures

The following electronic (e-signature) methods may be utilized for University transactions:

1. SOFTWARE PROGRAM (i.e., DocuSign, Adobe Sign)

Any type of e-signature may be created through a software program if all the following criteria are met:

- The software system tracks the signature process;
- The software system logically associates all the signed record's components, such as the identity of the signer and the date and time of signature;
- The circumstances surrounding the creation of the signature tend to validate that the signature was in fact affixed by the individual whose signature is represented to be on the document; and
- The e-signed document is retained in its entirety for the University's records.

2. PIN OR PASSWORD

An e-signature created through use of a personal identification number (PIN) or password, if all the following criteria are met:

- Information is available that tends to validate that the e-signature was affixed by the individual represented to be the person completing the form or document (e.g., the PIN and/or password are created and maintained in a secure fashion); and
- The e-signed document is retained in its entirety for the University's records.

3. DIGITAL SIGNATURE

A digital signature, if all the following criteria are met:

- A private user signing key and a public validation key is used to verify that the document was not altered after signing.
- The public key is issued by a certification authority that binds individuals to private keys and issues and manages certificates.
- The signature is indicated by a unique mark (called a "signed hash").

Contact the University's IT department regarding allowable software programs for creating esignatures or to review potential software programs.

SPECIFIC TRANSACTIONS

The division of Finance and Administration and the department of Information Technology may recommend or require the use of specific e-signature methods for specific transactions based upon the levels of risk involved (e.g., amount of money at issue).
